

The Command line is a text interface for your PC. It's a program that takes in commands, which it gives to the PC's operating framework to run. From the command line, you can explore through records and organize on your PC. The GUI is fundamentally the similar, the primary distinction being that the Graphical User Interface (GUI) permits the client to collaborate with the framework utilizing graphical components, for example, windows, symbols, menus while the Command Line Interface (CLI) permits the client to connect with the framework utilizing commands themselves. As for me I like many, mainly use GUI for anything day to day but certainly have used command line. Most of my interactions with it have been for gaming and setting that up on my computer and of course previous web design classes.
